Manufacturer: InterOpto

Referention number: IO-STR-10

Full product description

The SI-01 Stripper is a tool used to remove insulation from optical cables using minimal human effort. By using clamping connectors, it is easier and faster to move the cover away from optical cables than using knives and hands. This is especially convenient when removing cables in medium-range branching. Replacing the knives fixed in the middle of the Stripper allows long-term use of this tool.

Features

- The cutting functions apply to loose or ribbon-type cables,
- By adjusting the length of the protruding part of the blades, cables of different diameters can be removed,
- Blade revolvers make it easy to position the knives in the cable cover. Cables with a diameter of 10 - 25mm can be without cover.

Technical data

- Fiber optic tool,
- For pulling insulation from a longitudinal or optical cable,
- Cut-off: diameter in the range of 6-12mm or 12-25mm.

Instructions for use

Tighten the clamp firmly on the cable (before permanently applying it to the objects).
